Professional Summary

Backend Developer with extensive experience in distributed systems design, performance optimization, and scalable solutions for production environments. Specialized in legacy code refactoring, technical debt mitigation, and infrastructure automation via CI/CD pipelines. Proven track record of ensuring operational efficiency under high concurrency with a strong focus on cloud services integration.

Technical Skills

Languages: Ruby, Python, Golang, JavaScript, TypeScript

Frameworks: Ruby on Rails, FastAPI

Databases: PostgreSQL, MySQL, AWS RDS, Redis

Cloud & DevOps: Docker, GitHub Actions, AWS (Lambda, S3), Heroku, Datadog, New Relic

Professional Experience

Full Stack Developer – *La Cocreadora*

Oct 2024 – Present

- Automated development infrastructure using Docker and continuous integration via GitHub Actions and Heroku, reducing deployment times by 85%.
- Designed and executed the progressive migration of a monolithic application, expanding functional code capacity by 200% and eliminating 90% of legacy technical debt.
- Standardized technical documentation and architecture manuals, optimizing engineering team onboarding times from 10 days down to 3 days.

Backend Developer – *Mercado Libre*

Mar 2021 – Apr 2024

- Developed critical features in Golang for the Mercado Envíos unit, optimizing distributed pipelines to support high-concurrency traffic exceeding 250k requests per minute.
- Implemented clean architectures based on Domain-Driven Design (DDD) and decoupled core components, introducing request retry queues to minimize production incidents to less than 1 per day.
- Contributed to a technical action plan for comprehensive resolution of the operational incident backlog, preventing estimated financial losses of \$100K.
- Instrumented proactive system monitoring using Datadog and New Relic, accelerating latency bottleneck identification by up to 87%.

Full Stack Developer – *KLYM*

Jun 2019 – Feb 2021

- Restructured data extraction systems (ETLs), replacing synchronous flows with a robust asynchronous architecture built on AWS Lambda, Python, and Airflow.
- Reduced data ingestion processing time from a 30-minute window to a stable 3-second execution, decreasing failure rates by 10%.

Education

- Electronic Engineering (Partial Coursework Completed) Universidad Nacional de Colombia (2012 – 2016)

Languages

- Spanish: Native
- English: B2 (intermediate)
